Capstone Project [Fall, 2019]

The University of West Florida

12/6/2019

CIS 4595

Dr. Bernd Owsnicki-Klewe

Setup and Compilation
1. Download and unzip the application from the master branch of GitHub.
2. The download .zip includes:
- Documentation
- WebContent
- initDatabase/initDatabase
- src
- .gitignore
- README.md
- connection.dat
- cred.dat
- web.war

3. Environment: This program has been tested in with Apache Tomcat within an Ubuntu Environment.

Running the Program
After unzipping the file folder, launch the Apache Tomcat manager. Next select the web.war to be deployed through the manager. This will create an instanced environment of the application to be accessed.

User input: User is to interact within the web application.

Output: User loads into the home page. They then either enter their credentials for login - which then takes them to their personal page or displays an error screen if inputs are not validated – or they enter an invite code – this then either sends them to a new user creation screen, or an invalid invite code error screen.
